Year 6: Evolution and Inheritance

National Curriculum Outlines:

- recognise that living things have changed over time and that fossils provide information about living things that inhabited the Earth millions of years ago
- recognise that living things produce offspring of the same kind, but normally offspring vary and are not identical to their parents
- identify how animals and plants are adapted to suit their environment in different ways and that adaptation may lead to evolution.

Key ideas and addressing misconceptions

How long evolution takes

- Children say I've never seen an animal change into a different type of animal!
- Teachers should be aware their students may struggle to realize that we see changes happen in populations of animals (not animals themselves) over many, many generations – taking thousands and millions of years.

Science and religion

- Children from religious and non-religious backgrounds can feel enthusiastic and positive about learning about evolution
- Science and religion are not necessarily incompatible
- The Church of England and The Pope are comfortable that Christianity is compatible with evolution.
- The scientific community is diverse. Some scientists have a religious faith and some do not.

It's not anthropomorphic

Teachers should avoid emotive language that implies forward thinking or a decision to evolve. Evolution is the effect of natural pressures acting on a population.

Avoid statements that promote anthropomorphic thinking

Any statements implying:

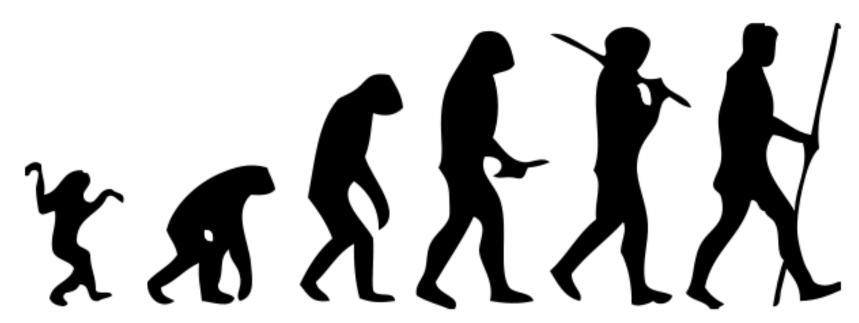

- thought or conscious intention
- goal-directed behavior
- ...evolved to reach food...

- ... <u>needs</u> ...
- ... <u>wants</u> ...
- the plant <u>seeks</u> light,
- some plants <u>prefer</u> shade
- the roots <u>try to find</u> water

A common graphic that encourages misconceptions

Misconception – Humans evolved from monkeys Reality – Humans and monkeys share a common ancestor. Humans evolved from apes

Show an evolutionary tree

Evolution by natural selection – Scientific framework

- 1. Individuals in a population show variation.
- 2. In certain conditions, some pre-existing variations are favourable.
- 3. Individuals with those variations are reproductively more successful
- 4. Those variations become more frequent in the population
- 5. Over many generations the population evolves
- 6. As conditions change, other pre-existing variations are favoured

Building understanding – through activities

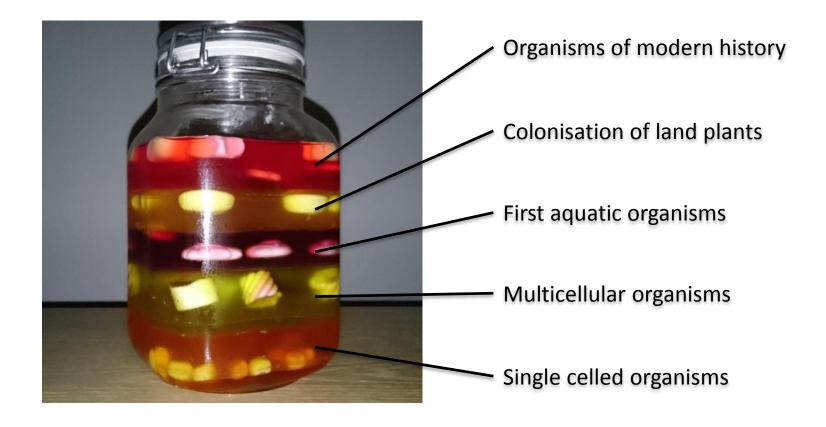

Activities

- Evolutionary history of life timeline
- Fossils a way to find out about things that existed in the past
- Adaptations dinosaurs, cacti, Venus flytrap
- Evolution by natural selection bird beaks

Fossils jelly

Evolutionary timeline of life

- Dinosaurs
- Cactus & Venus flytrap

Bird Beak Investigation

bird beak investigation

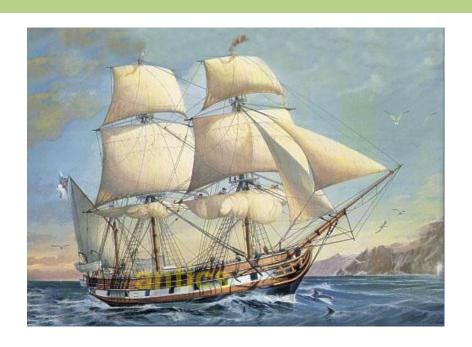

Bird beak investigation is a hands on activity where children use tools to pick up 'food' and discover which beaks are effective for which foods.

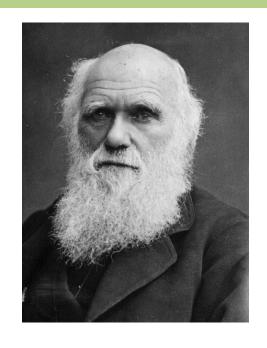

The Galapagos finches have different beak shapes on the various islands. Their beaks are adapted to the available food in each location.

Darwin

Display activity for your classroom. Follow Darwin on his voyage around the world on the Beagle. Divide your class into small groups and have them write about certain points on his voyage. Pin these pieces to the display at the location he visited!

Toucan and Hummingbird

The toucan's beak IS

adapted to grabbing and crushing fruit and nuts. It is strong like a nutcracker.

Try to introduce these key words to your students! Instead of saying 'a toucans beak' use terms like adapted, adaptation, evolved!
